Experiment No:06

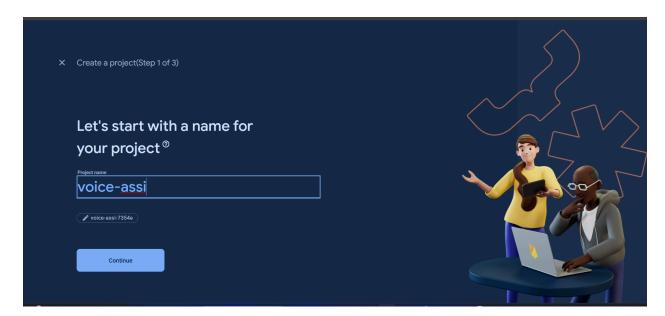

Aim: How To Set Up Firebase with Flutter for iOS and Android Apps

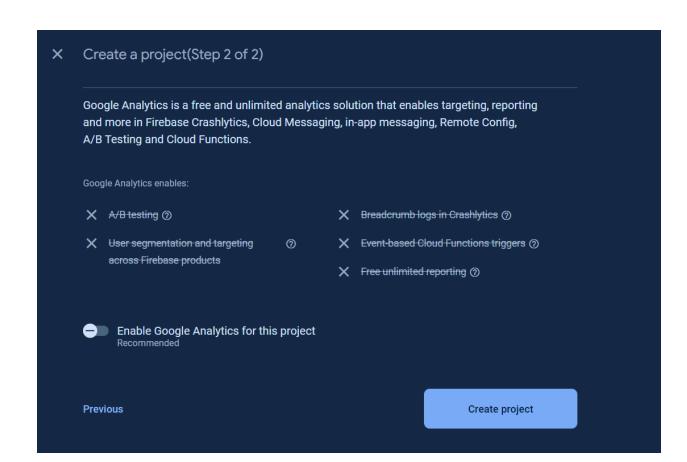

Theory:

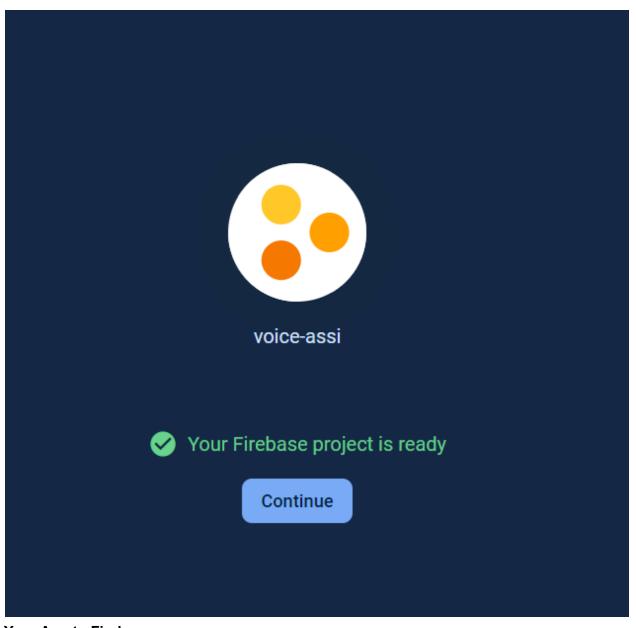

Firebase is a comprehensive platform provided by Google for developing mobile and web applications. It offers a wide range of features, including authentication, real-time database, cloud storage, hosting, and more, making it a popular choice for app development. Integrating Firebase with Flutter for both iOS and Android apps involves several steps:

1. Create a Firebase Project:

- Start by creating a new project on the Firebase console (console.firebase.google.com).
- Follow the prompts to set up your project, including providing a project name and enabling Google Analytics.

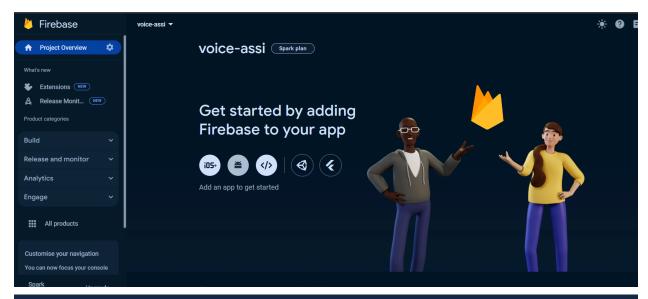

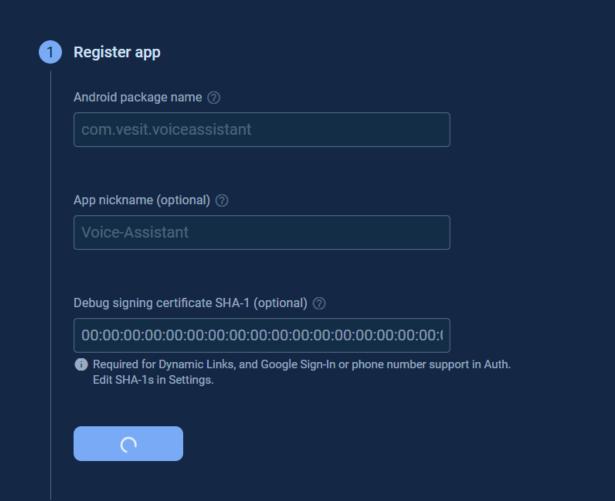

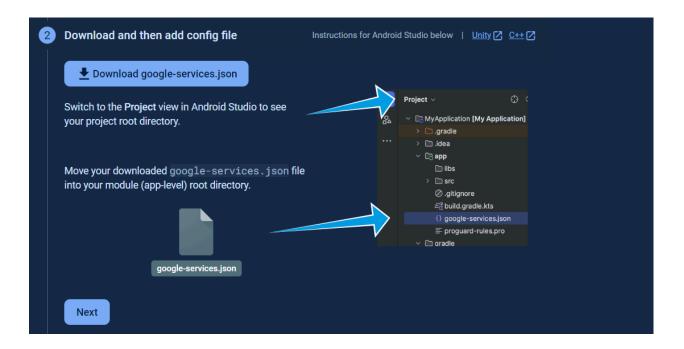

2. Add Your App to Firebase:

- After creating the project, add your Flutter app to it by clicking on the "Add App" button and selecting the appropriate platform (iOS or Android).
- Follow the instructions to register your app with Firebase. For Android, you'll need to provide your app's package name, and for iOS, you'll need to upload your app's GoogleService-Info.plist file.

3. Configure Firebase SDK:

- For Android:
 - Add the Firebase SDK to your Flutter project by adding the required dependencies in your build.gradle file.
 - Update the android/build.gradle file to include the Google services classpath.
 - Add the google-services.json file to the android/app directory.
- For iOS:
 - Add the Firebase SDK to your Flutter project by adding the required dependencies in your Podfile.
 - Add the GoogleService-Info.plist file to the ios/Runner directory.

```
buildscript {
    ext.kotlin_version = '1.7.10'
    repositories {
        google()
        mavenCentral()
    }

    dependencies {
        classpath 'com.android.tools.build:gradle:7.2.0'
        classpath "org.jetbrains.kotlin:kotlin-gradle-plugin:$kotlin_version"
        classpath "com.google.gms:google-services:4.3.15"
    }
}
```

```
def flutterVersionName = localProperties.getProperty('flutter.versionName')
if (flutterVersionName == null) {
    flutterVersionName = '1.0'
}
apply plugin: 'com.android.application'
apply plugin: 'kotlin-android'
apply plugin: "com.google.gms.google-services"
apply from: "$flutterRoot/packages/flutter_tools/gradle/flutter.gradle"
android {
    compileSdkVersion flutter.compileSdkVersion
    ndkVersion flutter.ndkVersion
    compileOptions {
```

4. Initialize Firebase:

• In your Flutter app, initialize Firebase by importing the necessary Firebase libraries and calling Firebase.initializeApp() in your main() function.

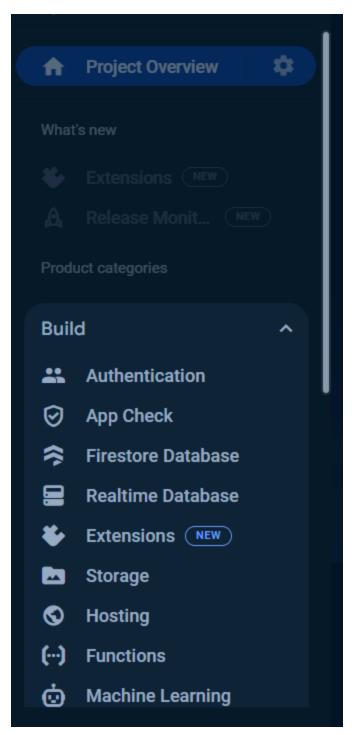

```
import 'package:allen/pallete.dart';
import 'package:flutter/material.dart';
import 'package:firebase_core/firebase_core.dart';
import 'package:firebase_auth/firebase_auth.dart';

Run|Debug|Profile
Future main() async {
    WidgetsFlutterBinding.ensureInitialized();
    await Firebase.initializeApp();
    runApp(const MyApp());
}

class MyApp extends StatelessWidget {
    const MyApp({super.key});
```

5. Add Firebase Services:

- Depending on your app's requirements, add the Firebase services you need, such as Authentication, Firestore, Realtime Database, Cloud Storage, etc.
- Follow the documentation provided by Firebase to set up and configure each service according to your app's needs.

6. Test Firebase Integration:

- Verify that Firebase is correctly integrated into your Flutter app by testing various Firebase features and services.
- Use Firebase Authentication to authenticate users, Firestore or Realtime Database to store and retrieve data, and other Firebase services as required.

7. Handle Platform-Specific Configurations (Optional):

• Depending on your app's requirements, you may need to handle platform-specific configurations for Firebase services, such as handling deep links, push notifications, etc.

```
{} google-services.json X
 EXPLORER
android > app > {} google-services.json > ...
                                Click here to ask Blackbox to help you code faster

✓ android

                                  "project_info": {
                                    "project_number": "521495811019",

✓ app

                                    "project_id": "voice-assistant-57b26",
   > src
                                    "storage_bucket": "voice-assistant-57b26.appspot.com"
  w build.gradle
                                  "client": [
  {} google-services.json
  > gradle
                                     "client_info": {
 gitignore
                                       "mobilesdk_app_id": "1:521495811019:android:370304f06230b4d2f65c46
 w build.gradle
                                        "android_client_info": {
 gradle.properties
                                          "package_name": "com.rivaan.allen.allen"
  ≡ gradlew
 gradlew.bat
                                      "oauth_client": [],
 local.properties
                                      "api_key": [
 settings.gradle
 > assets
                                          "current_key": "AIzaSyC3lvzgK2LJ8WCCIWNSRDyWcdqHnxt6bKo"
```

Conclusion:

I have successfully understood and implemented ,How To Set Up Firebase with Flutter for iOS and Android Apps
